Practical 5

Binary Search Tree: Write a program to:

a. Create a binary search tree.

Code :

```
class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None

root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')
nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')

root.left = nodeA
root.right = nodeB

nodeA.left = nodeC
nodeA.right = nodeD

nodeB.left = nodeE
nodeB.right = nodeF

nodeF.left = nodeG
print("root.right.left.data:", root.right.left.data)
```

Output :

```
root.right.left.data: E
>
```

b. Insert nodes into a binary search tree.

Code :

```
class TreeNode:
    def __init__(self, data):
        self.data = data
        self.left = None
        self.right = None

root = TreeNode('R')
nodeA = TreeNode('A')
nodeB = TreeNode('B')
nodeC = TreeNode('C')
nodeD = TreeNode('D')
nodeE = TreeNode('E')
nodeF = TreeNode('F')
nodeG = TreeNode('G')

root.left = nodeA
root.right = nodeB

nodeA.left = nodeC
nodeA.right = nodeD

nodeB.left = nodeE
nodeB.right = nodeF

nodeF.left = nodeG
#Test
print("root.right.left.data:", root.right.left.data)

def search(root, key):
    if root is None:
        return False

    print("Checking:", root.data)

    if root.data == key:
        return True

    return search(root.left, key) or search(root.right, key)

key = input("Enter element to search: ")

# Search
if search(root, key):
    print("Element Found")
else:
    print("Element Not Found")
print("Jay_28|")
```

Output :

```
==== RESTART: C:/Users/IT-4//AppData/Local/Programs/Python/Python38-3/Python.exe
root.right.left.data: E
Enter element to search: E
Checking: R
Checking: A
Checking: C
Checking: D
Checking: B
Checking: E
Element Found
Jay_28
|
```

c. Search for a node in a binary search tree.

Code :

```
def insert(root, data):
    if root is None:
        return TreeNode(data)

    if data < root.data:
        root.left = insert(root.left, data)
    elif data > root.data:
        root.right = insert(root.right, data)

    return root

new_node = input("Enter element to insert: ")
root = insert(root, new_node)

print("Node inserted successfully.")
```

Output :

```
==== RESTART: C:/Users/IT-4//AppData/Local/Programs/Python/Python38-3/Python.exe
root.right.left.data: E
Enter element to insert: J
Node inserted successfully.
```
